

**VECTOR SURVEILLANCE IN NEW JERSEY**  
**EEE, WNV, SLE and LAC**  
**CDC WEEK 27: July 5 to July 11, 2009**

Prepared by Lisa M. Reed, Scott Crans, Dina  
Fonseca and Randy Gaugler at the Center for  
Vector Biology, Rutgers University.  
Supported by funding from the NJ State  
Mosquito Control Commission.

*Culiseta melanura* and Eastern Equine Encephalitis

SITE	Inland / Coastal	Historic Mean	Current Weekly Mean	Total Tested to Date*	Total Pools Submitted	EEE Isolations	MFIR
<b>Green Bank</b> (Burlington County)	Coastal	3.0	0.56	81	19	0	0
<b>Corbin City</b> (Atlantic County)	Coastal	0.8	0.28	18	9	0	0
<b>Dennisville</b> (Cape May County)	Coastal	3.9	0.53	428	24	0	0
<b>Waterford</b> (Camden County)	Inland	1.7	0	11	4	0	0
<b>Centerton</b> (Salem County)	Inland	2.7	0.28	166	21	0	0
<b>Turkey Swamp</b> (Monmouth County)	Inland	0.9	0.62	38	13	0	0
<b>Glassboro</b> (Gloucester County)	Inland	0	no collection	153	20	0	0

\*Including trial run last week in May.

**Remarks:** *Culiseta melanura* populations continue to be lower than historical values. Normally, at this point in time, it would not be unusual to see small increases in the populations as the second generation for these southern New Jersey populations emerge. Cooler June temperatures may have an impact on the timing of emergence for this second (and amplifying) generation (Crans and Mahmood 1998 Does bi-voltinism in *Culiseta melanura* regulate the amplification of EEE? 86<sup>th</sup> Proceedings of the NJMCA 13-16). No eastern equine encephalitis virus has been detected at the six traditional resting box sites to this point in time. A collection was not made in Glassboro in anticipation of moving the site.

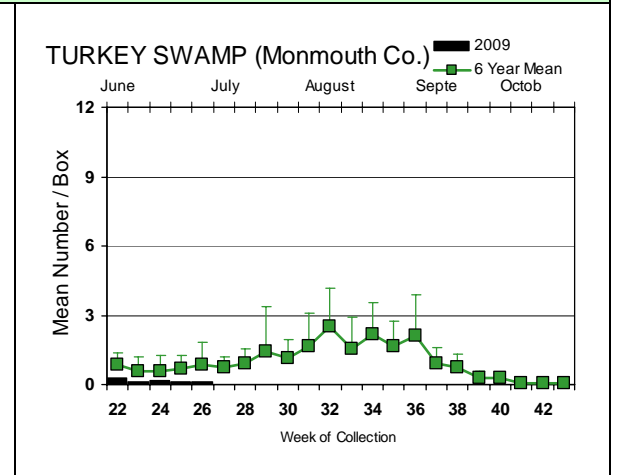

To date, 110 pools from 895 *Cs. melanura* mosquitoes have been sent for EEE testing from the seven resting box collections (NOTE: this value was re-adjusted from last week). Previously, Ocean County has submitted *Cs. melanura* samples collected from gravid and CO<sub>2</sub> traps while Gloucester County has sampled additional sites with resting boxes. Other species tested for EEE from resting boxes include: *Aedes atlanticus*, *Ae. japonicus*, *Ae. triseriatus*, *Anopheles punctipennis*, *An. quadrimaculatus*, *Culex erraticus*, *Cx. pipiens*, *Cx. restuans*, *Cx. salinarius*, Mixed *Culex* pools, and *Cx. territans*. Additional species from other trap types include: *Ae. abserratus*, *Ae. albopictus*, *Ae. canadensis*, *Ae. triseriatus*, *Ae. trivittatus*, *Ae. sollicitans*, *Ae. vexans*, *An. bradleyi*, *Coquillettidia perturbans* and *Culiseta inornata*. All 159 pools of 2019 mosquitoes are reported negative for EEE virus.

# Culiseta melanura Population Graphs

## Coastal

## Inland

Resting box populations of *Culiseta melanura* continue to track lower than recent historical trends at all sites. Patterns for this species in the Statewide Adult Mosquito Surveillance program reflect similar patterns. No EEE activity was detected.

**EEE in US (2009 cumulative cases):** (Red = new reported cases occurring)

- equine: 6(AL) 34(FL) 15(GA) 3(LA) 1(MO) 6(MS) 1(VA)
- mosquito: 1(LA)
- sentinel: 2(AL) 69/39wild(FL)
- human:

## West Nile Virus

**West Nile in US (2009 cumulative cases):** Single black values indicate no change from previous week. Black values / red values equals previous week/**New totals**.

<b>State Total</b>	<b>2373</b>	<b>60,481</b>	<b>2</b>	<b>0.033</b>

**Remarks:** The number of pools positive for West Nile virus remains at two, one each from Mercer and Bergen counties. These two counties include highly urban/suburbanized areas typical of WNV activity in New Jersey. Activity last year at this time was much higher: there were 35 positive pools from 10 counties.

**Humans, Horses and Wild Birds:** No humans have been reported positive for WNV by PHEL. For more details plus information about WNV, see the PHEL's West Nile Virus Alert and FAQ Sheets:

<http://www.state.nj.us/health/cd/westnile/enceph.htm>

No confirmed horse cases have occurred. No positive birds have been detected as of this week.

Recent Activity to 11 July 2009

## WNV Risk of Exposure Model

This is Phase 1 of our WNV Risk Exposure model presentation. Our WNV risk model begins with a simple linear relationship we have found between overall mosquito MFIR values and the number of human cases that appeared two weeks later. This relationship was developed using statewide values from 2002 to 2006. The regression model, graphed to the left, explains over 50% of the variation observed. We've continued to explore the variables that contribute to WNV cases, and will present more precise models on this page in the future.

Using ArcMap 9.2, we applied this linear relationship of overall mosquito MFIR values at the county level to calculate a “risk of exposure.” Since this calculation was for the county as a whole, each county point was fixed within the county using the county seat (green diamond symbols). The values used in the linear regression were reported during Week 25 (the two week lag) of the Vector Surveillance Program from the WNV Results By County table.

Risk is rated from minimal exposure (no positive pools found) through to high risk (positive mosquitoes found) with several risk levels in between. Risk is interpolated from each of the 21 county points in equal gradients. It should be noted that minimal risk does not mean no risk and that high risk cannot be mediated by mosquito bite avoidance behavior.

Areas of higher risk are noted in Bergen and Mercer counties. These are both counties that reported a single positive *Culex* pool during the past few weeks. Because Bergen County had fewer overall mosquitoes submitted, their risk value for the same number of positive mosquito pools (i.e., 1) is higher than for Mercer County.

NOTE: These maps are presented as an additional early warning tool available for counties to use as part of their decision-making processes for controlling public-health mosquitoes. It should be understood that *minimal risk does not mean no risk* and that everyone should use [personal protection](#) to avoid mosquito bites.

## Saint Louis Encephalitis (SLE) through 11 July 2009.

New Jersey will be selectively testing for SLE this year. SLE has had previous activity in New Jersey, most notably in 1964 and 1975 (CDC's SLE [website](#)), the latter prompting the surveillance reporting by Rutgers. SLE is a flavivirus and has a similar transmission pattern to West Nile, with *Culex* species as the predominant vectors.

<i>Culex restuans</i>	63	1039		
<i>Culex spp.</i>	31	1497		

Specimens submitted by the counties continue to be negative for SLE.

### La Crosse Encephalitis (LAC) through 11 July 2009.

New Jersey will be selectively testing for La Crosse (LAC) virus this year. New Jersey has had 3 cases of this encephalitic disease since 1964 (see CDC's LAC [website](#)). The mortality is low but like other encephalitides, LAC can have both personal (lasting neurological sequelae) and economic impacts. LAC is a bunyavirus with a transmission cycle involving mosquitoes such as *Aedes triseriatus* and small mammals such as squirrels and chipmunks. LAC can also infect *Aedes albopictus* and transovarial transmission was demonstrated (Tesh and Gubler 1975 Laboratory studies of transovarial transmission of La Crosse and other arboviruses by *Aedes albopictus* and *Culex fatigans*. American Journal of Tropical Medicine and Hygiene 24(5):876-880).
