

# VECTOR SURVEILLANCE IN NEW JERSEY

## EEE, WNV, SLE, LAC, DENV, CHIK and ZIKV

Prepared by Lisa M. Reed and Dina Fonseca  
 Center for Vector Biology, Rutgers University  
 CDC WEEK 36: 3 September to 9 September, 2017

This New Jersey Agricultural Experiment Station report is supported by Rutgers University, Hatch funds, funding from the NJ State Mosquito Control Commission and with the participation of the Department of Health, Department of Agriculture and of the 21 county mosquito control agencies of New Jersey.

### *Culiseta melanura* and Eastern Equine Encephalitis

SITE/Boxes	Inland or Coastal	Historic Population Mean	Current Weekly Mean	Total Tested* (Collected)	Total Pools Tested* (Submitted)	EEE Isolation Pools	MFIR
Bass River (Burlington Co.)/5	Coastal	0.74	0.80	14 (18)	4 (5)		
Green Bank (Burlington Co.)/18	Coastal	3.41	0.76	114 (133)	8 (9)		
Corbin City (Atlantic Co.)/25	Coastal	2.36	1.56	223 (262)	14 (15)		
Dennisville (Cape May Co.)/50	Coastal	5.07	0.02	98	10		
Winslow (Camden Co.)/50	Inland	1.59	0.72	813	24		
Centerton (Salem Co.)/50	Inland	2.97	2.18	526	20	3	5.70
Turkey Swamp (Monmouth Co.)/50	Inland	1.95	0.28	183 (197)	13 (14)		
Glassboro (Gloucester Co.)/50	Inland	0.51	0.62	158	14		

\*Current week (in parentheses) results pending. ‡ corrected from previous week NC=no collection

**Remarks:** A total of seven positive EEE pools have been detected in a *Culiseta melanura*. The latest two positives were found at the Centerton resting box site. One horse cases was previously reported in Cumberland County. NOTE: Despite impending cooler weather, due diligence is required as *Culiseta melanura* is a cold tolerant species and will be active late into the season.

Statewide, 5,220 *Cs. melanura* from 436 pools have been tested, with seven positive pools detected for an overall *Cs. melanura* MFIR of 1.341. 9,986 specimens from 16 other species have also been tested, with no positives detected. Overall MFIR for all species statewide is 0.460.

**Traditional Resting Box Sites:** 2,129 *Cs. melanura* from 107 pools have been tested for EEE, with 76 additional *Cs. melanura* from 4 pools to be tested. Three positive pools were detected at the Centerton site; the last two positive pools were collected 6 Sept.

Additional <i>Cs. melanura</i> trapped by counties					
*traps with positives indicated in <b>BOLD</b> .					
County	Trap types*	Pools	Mosquitoes	Positives	MFIR

<b>TOTAL</b>		<b>329</b>	<b>3091</b>	<b>4</b>	<b>1.29</b>

**Additional County-set *Cs. melanura*:**

Counties maintain trap sites for *Cs. melanura* in other areas, using a variety of traps. Previously, four positive pools were collected from county-set sites - Cape May and Cumberland counties were both collected on 17 Aug. First county-set detection occurred in Burlington County UVLTs.

**Horses and Humans:** One horse has been detected with EEE in New Jersey. This was a 5 yo mare from Cumberland County, with onset date of 23 Aug, euthanized on 28 Aug. There was no vaccination history. Nearly all of the horse cases from previous years include those horses who were either not vaccinated or had incomplete vaccination histories. **Horse owners are urged to make sure their horses are up to date on their vaccinations. Horse cases are known to occur through October and sometimes into November (see link below).** Other sensitive species are non-native birds, such as Ostriches/Emus and Gallinaceous birds such as pheasants of Eurasian origins.

**Horses and Vaccinations:** The fate of unvaccinated equids reinforces the necessity of maintaining a vaccination schedule for arboviruses. For vaccination schedules recommended by the American Association of Equine Practices, see: [http://www.aaep.org/vaccination\\_guidelines.htm](http://www.aaep.org/vaccination_guidelines.htm)

**Additional Species:** Sixteen additional species were tested for EEE. No additional positives were detected. Previously reported *Aedes provocans* was re-assigned to *Anopheles punctipennis*.

# Culiseta melanura Population Graphs

## Coastal

## Inland

Three detections of EEE has occurred at Centerton, the last two collected 6 September. Mosquito populations at the traditional resting box sites increased or did not change at 5 out of the 8 locations. One positive horse was previously reported and due diligence should be continued even when temperatures decrease – *Culiseta melanura* is a cold tolerant species. Positive pools continue to be in the southern half of the state..

= Positive pool(s) detected (red = melanura, purple = other species).

**EEE in US** (2017 cumulative cases): (Black or Red = previous + new reported cases occurring)

<i>Culex territans</i>	42	109		
<i>Culiseta inornata</i>	1	1		
<i>Culiseta melanura</i>	439	5227	5	0.957
<i>Orthopodomyia signifera</i>	6	6		
<i>Psorophora ciliata</i>	3	3		
<i>Psorophora columbiae</i>	19	74	1	13.514
<i>Psorophora cyanescens</i>	1	1		
<i>Psorophora ferox</i>	15	274		
<i>Uranotaenia sapphirina</i>	2	23		
<b>Grand Total</b>	<b>6219</b>	<b>124057</b>	<b>498</b>	<b>4.014</b>

**Remarks:** To date, 6,219 pools of 124,057 mosquitoes from 34 species have been tested. 498 positive pools have been detected. Most continue to be in the enzootic vector, *Culex* (Mix, *pipiens* or *restuans* = 96%). A positive pool of *Anopheles crucians* was detected this past week. Overall MFIR for New Jersey is at 4.014, up from 3.602 of last week. First positive *Culex* Mix pool was detected in Sussex County on 12 June. Last year, the first positive pool of *Culex* Mix was collected on 14 June in Monmouth County.

**Humans, Horses and Wild Birds:** One human case of WNV was detected in a person from Atlantic County. No horse cases have been detected yet. Last year, human cases were first reported in CDC week 20, but under unusual circumstances. First typical case occurred in CDC week 27. For further information, see <http://www.nj.gov/health/cd/statistics/arboviral-stats/>.

Birds are no longer routinely tested in New Jersey.

Above is a graph showing cumulative number of positive pools for the last 9 years, inclusive of the most active (2012) and least active (2009) years. While it is still early, there was a decrease in the cumulative positives, suggesting a possible low to moderate activity (black markers with pink borders for current year).

### WNV Results by County through 9 September 2017.

Cumulative WNV activity in 2016. WNV activity to 9 September 2017. WNV activity last week, 2017

### Saint Louis Encephalitis (SLE) to 9 September 2017.

New Jersey will be primarily testing for SLE this year only when adjacent states show human activity (Cape May tests mosquitoes in the Cape May lab independently). SLE has had previous activity in New Jersey, most notably in 1964 and 1975 (CDC's SLE [website](#)), the latter prompting the surveillance reporting by Rutgers. SLE is a flavivirus and has a similar transmission pattern to West Nile, with *Culex* species as the predominant vectors.

No pools of SLE have tested positive for 2017. No human cases have been reported.

County	Species	Pools	Mosquitoes	Positives	MFIR
<b>Burlington</b>		<b>12</b>	<b>721</b>		
	<i>Culex</i> spp.	12	721		
<b>Cape May</b>		<b>583</b>	<b>4818</b>		
	<i>Culex pipiens</i>	562	4777		
	<i>Culex</i> spp.	21	41		
<b>Grand Total</b>		<b>595</b>	<b>5539</b>		

### La Crosse Encephalitis (LAC) to 9 September 2017.

New Jersey will be primarily testing for LAC this year only when adjacent states show human activity (Cape May tests mosquitoes in the Cape May lab independently). New Jersey has had 3 cases of this encephalitic disease since 1964 (see CDC's LAC [website](#)). The mortality is low but like other encephalitides, LAC can have both personal (lasting neurological sequelae) and economic impacts. LAC is a bunyavirus with a transmission cycle involving mosquitoes such as *Aedes triseriatus* and small mammals such as squirrels and chipmunks. LAC can not only infect *Aedes albopictus* but transovarial transmission was also demonstrated.

(Tesh and Gubler 1975 Laboratory studies of transovarial transmission of La Crosse and other arboviruses by *Aedes albopictus* and *Culex fatigans*. American Journal of Tropical Medicine and Hygiene 24(5):876-880).

No pools of SLE have tested positive for 2017. No human cases have been reported.

	<i>Aedes triseriatus</i>	24	124		
<b>Grand Total</b>		<b>39</b>	<b>421</b>		

### Dengue (DENV) to 9 September 2017.

New Jersey will be selectively testing for DENV (including serotypes) this year. Dengue has not had a history of local transmission here in New Jersey, but each year, travelers can bring virus back from areas in the world with virus activity. This is significant as humans are NOT dead-end hosts and thus there is the potential for local transmission (i.e., New Jersey mosquitoes biting a sick person and then biting and transmitting the disease to someone else) to be established. DENV is a flavivirus but unlike WNV, *Aedes* mosquitoes are predominant vectors. In New Jersey, *Aedes albopictus* is a candidate for local transmission. There are 4 serotypes tested for Dengue.

\*Note\* Same pools of *Ae. albopictus* are tested for the four serotypes of Dengue as well as Chikungunya.

No pools of Dengue have tested positive in 2017. There are 3 travel-related human cases in NJ.

County	Species	DENV1		DENV2		DENV3		DENV4		Pos.	MFIR
		Pool	Mos.	Pool	Mos.	Pool	Mos.	Pool	Mos.		
<b>Mercer</b>		<b>8</b>	<b>87</b>	<b>8</b>	<b>87</b>	<b>8</b>	<b>87</b>	<b>8</b>	<b>87</b>		
	<i>Aedes albopictus</i>	8	87	8	87	8	87	8	87		
<b>Grand Total</b>		<b>8</b>	<b>87</b>	<b>8</b>	<b>87</b>	<b>8</b>	<b>87</b>	<b>8</b>	<b>87</b>		

### Chikungunya (CHIK) to 9 September 2017.

New Jersey will be selectively testing for CHIK this year. Chikungunya is similar in symptoms to Dengue, a “breakbone” fever and has a low mortality rate. But this virus has had recent worldwide activity, and in the past year has come to the Western Hemisphere. As with Dengue, transmission can occur when a mosquito bites an infected human, then bites an uninfected human who subsequently becomes ill. CHIK is an alphavirus with *Aedes* mosquitoes as potential vectors. In New Jersey, *Aedes albopictus* is the mosquito of interest.

No pools of CHIK have tested positive in 2017. There are 3 travel-related human cases in NJ.

County	Species	Pools	Mosquitoes	Positives	MFIR
<b>Cape May</b>		<b>432</b>	<b>1173</b>		
	<i>Aedes albopictus</i>	432	1173		
<b>Mercer</b>		<b>8</b>	<b>87</b>		
	<i>Aedes albopictus</i>	8	87		
<b>Grand Total</b>		<b>440</b>	<b>1260</b>		

## Zika (ZIKV) to 9 September 2017.

New Jersey will be selectively testing for ZIKV this year. Zika is an emerging arboviral threat with significant health consequences for fetuses and recent activity in the Western Hemisphere. Humans are potential hosts that can transmit through sexual activity. ZIKV is a flavivirus with *Aedes* mosquitoes as potential vectors. In New Jersey, *Aedes albopictus* is the mosquito of interest.

No pools have tested positive in 2017. There are 21 travel-related human cases in NJ.
