

# VECTOR SURVEILLANCE IN NEW JERSEY

EEE, WNV, SLE, LAC, DENV, CHIK and ZIKV

Prepared by Lisa M. Reed, Diana Carle and Dina Fonseca

Center for Vector Biology, Rutgers University

CDC WEEK 33: 12 August to 18 August, 2018

This New Jersey Agricultural Experiment Station report is supported by Rutgers University, Hatch funds, funding from the NJ State Mosquito Control Commission and with the participation of the Department of Health, Department of Agriculture and of the 21 county mosquito control agencies of New Jersey.

## *Culiseta melanura* and Eastern Equine Encephalitis

SITE/Boxes	Inland or Coastal	Historic Population Mean	Current Weekly Mean	Total Tested* (Collected)	Total Pools Tested* (Submitted)	EEE Isolation Pools	MFIR
Bass River (Burlington Co.)/5	Coastal	0.28	0.40	1 (3)	1 (2)		
Green Bank (Burlington Co.)/25	Coastal	4.57	0.24	36 (42)	7 (8)		
Corbin City (Atlantic Co.)/25	Coastal	1.37	1.40	77 <sup>‡</sup> (106)	10 (11)		
Dennisville (Cape May Co.)/50	Coastal	5.74	0.44	284	13		
Winslow (Camden Co.)/50	Inland	1.66	3.58	1647	39	4	2.429
Centerton (Salem Co.)/50	Inland	3.53	0.44	219	12	2	9.132
Turkey Swamp (Monmouth Co.)/50	Inland	1.68	0.92	195 (213)	11 (12)		
Glassboro (Gloucester Co.)/50	Inland	0.57	0.02	117	10		

\*Current week (in parentheses) results pending. ‡ corrected from previous week NC=no collection

**Remarks:** Currently for the 2018 season, there are seven detections of EEE among submitted mosquito pools, six at resting box sites (4 at Winslow and 2 at Centerton) with the two latest from the traditional resting box sites. All are in the enzootic vector, *Culiseta melanura*.

Statewide, 4903 *Cs. melanura* from 312 pools have been tested, with seven positive pools detected for an overall *Cs. melanura* MFIR of 1.428. 10021 specimens in 845 pools from 16 other species have also been tested, with no positives detected. Overall MFIR for all species statewide is 0.402.

**Traditional Resting Box Sites:** 2576 *Cs. melanura* from 103 pools have been tested for EEE (plus four pools totaling 89 to be tested) in 2018. Two additional EEE pools were detected, collected during week 33 at Centerton and Winslow, in addition to the four positive EEE pools previously detected from these two sites.

Additional <i>Cs. melanura</i> trapped by counties *traps with positives indicated in <b>BOLD</b> .					
County	Trap types*	Pools	Mosquitoes	Positives	MFIR
Atlantic	CO2, RB	22	566	1	0.862
Bergen	RB	6	14		
Burlington	CDCL	27	1160

Morris	CDCL	1	1		
Ocean	CDCL, RB	18	117		
Passaic	RB	1	1		
Salem	CDCL	3	46		
Sussex	ABC	8	69		
Warren	CDCL	1	6		
<b>TOTAL</b>		<b>209</b>	<b>2327</b>	1	0.430

**Additional County-set *Cs. melanura*:** Counties maintain trap sites for *Cs. melanura* in other areas, using a variety of traps. One positive pool has been detected, collected on 6 August in Burlington County in a CDC trap with light.

**Horses and Humans:** Currently, there is no horse or human cases reported. Last year, there were 6 horses detected with EEE. EEE is nearly always fatal for those horses without a complete vaccination history. Horses in New Jersey that have gone down in the past with EEE have either an incomplete vaccination history or NO vaccination history. Note that Florida is experiencing early and continued EEE activity with horse and now 1 human case. ***Horse owners are urged to make sure their horses are up to date on their vaccinations. Horse cases are known to occur through October and sometimes into November (see link below).*** Other sensitive species are non-native birds, such as Ostriches/Emus and Gallinaceous birds such as pheasants of Eurasian origins.

**Horses and Vaccinations:** The fate of unvaccinated equids reinforces the necessity of maintaining a vaccination schedule for arboviruses. For vaccination schedules recommended by the American Association of Equine Practices, see: [http://www.aaep.org/vaccination\\_guidelines.htm](http://www.aaep.org/vaccination_guidelines.htm)

**Additional Species:** Sixteen additional species were tested for EEE. No positives were detected.

Species other than <i>Cs. melanura</i>	Pools	Mosquitoes	Positives	MFIR
<i>Aedes albopictus</i>	1	1		
<i>Aedes canadensis canadensis</i>	1	10		
<i>Aedes cantator</i>	2	2		
<i>Aedes infirmatus</i>	1	1		
<i>Aedes sollicitans</i>	6	32

# Culiseta melanura Populations

## Coastal

BASS RIVER (Burlington Co.)

GREEN BANK (Burlington Co.)

CORBINCITY (Atlantic Co.)

DENNISVILLE (Cape May Co.)

## Inland

WINSLOW (Camden Co.)

CENTERTON (Salem Co.)

TURKEY SWAMP (Monmouth Co.)

GLASSBORO (Gloucester Co.)

Winslow had not only a high increase in abundances, but two additional detections of EEE virus. Populations have increased at Bass River, Green Bank, Corbin City, Dennisville, Winslow and Glassboro from the previous week.

↓ = Positive pool(s) detected (red = melanura, purple = other species).

**EEE in US** (2018 cumulative cases): (Black or Red = previous + new reported cases occurring)

- **equine: FL(48/2 mule & donkey)**
- **mosquito pools: FL(2) NJ(7) NY(3) RI(4)**
- **sentinel: FL(123/6 owl emus & 5 emu flocks) DE(2)**
- **human: FL(3)**

## West Nile Virus Positive Organisms in US, 2018

West Nile in US (2017 cumulative cases): Single black values indicate no change from previous week. Black values / red values equals previous week/**New totals**.

Note: Data reported by all states should be considered provisional and subject to change. Sources for this table can be found [here](#).

<i>Culex territans</i>	13	62		
<i>Culiseta inornata</i>	1	10		
<i>Culiseta melanura</i>	314	4905	6	1.223
<i>Orthopodomyia signifera</i>	2	3		
<i>Psorophora ciliata</i>	1	6		
<i>Psorophora columbiae</i>	8	25		
<i>Psorophora ferox</i>	33	526		
<i>Uranotaenia sapphirina</i>	1	1		
<b>Grand Total</b>	<b>5040</b>	<b>114666</b>	<b>505</b>	<b>4.404</b>

**Remarks:** To date, 5040 pools of 114,666 mosquitoes from 33 species have been tested. A total of 505 positive WNV pools have been detected throughout the state. The bulk of new positives continue to be in the enzootic vector(s) *Culex* spp. First positive WNV pool detected has been revised from 7 June 2018 in Warren County to 5 June in Gloucester County, in *Culex pipiens*. Last year, the first positive *Culex* Mix pool was detected in Sussex County on 12 June and the first non-*Culex* positive was collected in *Aedes albopictus* on 14 July in Gloucester County. This year, the first non-*Culex* positive species was *Aedes japonicus*, also collected in Gloucester County on 7 JUNE, more than one month earlier. Other positive non-*Culex* species include *Aedes albopictus*, *Ae. triseriatus*, *Ae. taeniorhynchus*, *Ae. vexans*, *Anopheles punctipennis*, *Coquillettidia perturbans*, *Culex erraticus*, and *Culiseta melanura*. The statewide MFIR rate for all mosquitoes is 4.404.

**\*NOTE\* - Additional WNV pools have been reported to the counties, but are not yet in the database. This report should be considered up for revision as necessary.**

**Humans, Horses and Wild Birds:** Currently three human cases of WNV have been detected; the latest two detected in Essex and Hudson counties in addition to the first case having occurred in Hunterdon county. No horse cases of WNV have been detected. In 2017, eight human cases of WNV were detected and two horse cases were detected. For further information, see <http://www.nj.gov/health/cd/statistics/arboviral-stats/>.

Birds are no longer routinely tested in New Jersey.

Above is a graph showing cumulative number of positive pools for the previous 9 years, inclusive of the most active (2012) and least active (2009) years. The red series represents this year and is suggestive of increased activity.

### WNV Results by County through 17 August 2018.

WNV activity to 17 August 2018.

WNV activity last week, 2018

## Saint Louis Encephalitis (SLE) to 17 August 2018.

New Jersey will be primarily testing for SLE this year only when adjacent states show human activity (Cape May tests mosquitoes in the Cape May lab independently). SLE has had previous activity in New Jersey, most notably in 1964 and 1975 (CDC's SLE [website](#)), the latter prompting the surveillance reporting by Rutgers. SLE is a flavivirus and has a similar transmission pattern to West Nile, with *Culex* species as the predominant vectors.

No pools of SLE have tested positive for 2018. No human cases have been reported.

## La Crosse Encephalitis (LAC) to 17 August 2018.

New Jersey will be primarily testing for LAC this year only when adjacent states show human activity (Cape May tests mosquitoes in the Cape May lab independently). New Jersey has had 3 cases of this encephalitic disease since 1964 (see CDC's LAC [website](#)). The mortality is low but like other encephalitides, LAC can have both personal (lasting neurological sequelae) and economic impacts. LAC is a bunyavirus with a transmission cycle involving mosquitoes such as *Aedes triseriatus* and small mammals such as squirrels and chipmunks. LAC can not only infect *Aedes albopictus* but transovarial transmission was also demonstrated.

(Tesh and Gubler 1975 Laboratory studies of transovarial transmission of La Crosse and other arboviruses by *Aedes albopictus* and *Culex fatigans*. American Journal of Tropical Medicine and Hygiene 24(5):876-880).

No pools of LAC have been tested yet for 2018. No human cases have been reported.

## Dengue (DENV) to 17 August 2018.

New Jersey will be selectively testing for DENV (including serotypes) this year. Dengue has not had a history of local transmission here in New Jersey, but each year, travelers can bring virus back from areas in the world with virus activity. This is significant as humans are NOT dead-end hosts and thus there is the potential for local transmission (i.e., New Jersey mosquitoes biting a sick person and then biting and transmitting the disease to someone else) to be established. DENV is a flavivirus but unlike WNV, *Aedes* mosquitoes are predominant vectors. In New Jersey, *Aedes albopictus* is a candidate for local transmission. There are 4 serotypes tested for Dengue.

\*Note\* Same pools of *Ae. albopictus* are tested for the four serotypes of Dengue as well as Chikungunya.

No pools of Dengue have been tested yet in 2018. There are currently 5 travel-related human cases in NJ.

### Chikungunya (CHIK) to 17 August 2018.

New Jersey will be selectively testing for CHIK this year. Chikungunya is similar in symptoms to Dengue, a “breakbone” fever and has a low mortality rate. But this virus has had recent worldwide activity, and in the past year has come to the Western Hemisphere. As with Dengue, transmission can occur when a mosquito bites an infected human, then bites an uninfected human who subsequently becomes ill. CHIK is an alphavirus with *Aedes* mosquitoes as potential vectors. In New Jersey, *Aedes albopictus* is the mosquito of interest.

No pools of CHIK have been tested yet in 2018. There are currently 5 travel-related human cases in NJ.

<b>Grand Total</b>		<b>51</b>	<b>526</b>		

### Zika (ZIKV) to 17 August 2018.

New Jersey will be selectively testing for ZIKV this year. Zika is an emerging arboviral threat with significant health consequences for fetuses and recent activity in the Western Hemisphere. Humans are potential hosts that can transmit through sexual activity. ZIKV is a flavivirus with *Aedes* mosquitoes as potential vectors. In New Jersey, *Aedes albopictus* is the mosquito of interest.

No pools have tested positive in 2018. There are currently 6 travel-related human cases in NJ.
